

04-151

I believe it is imperative that there be spectrum which will be available, no matter what crowding of the ISM band may exist, for the purpose of cost effective wireless broadband. For this to be possible, it needs to be either license exempt or very minimal filing costs to use spectrum dedicated to wireless broadband services. This is a distinct possibility with 3.650 Ghz, because it is not now open to all other uses, and the spectrum can be maintained orderly and well-used.
